Syllabus

Course Syllabus

Introduction

The course is intended for professionals in IT technical and non-technical work areas who need to acquire a high competency in IT project management including project control, documentation, tools and processes.

IT Projects are difficult as they demand constant attention and control. IT projects now live in an agile world where things can happen and the project manager must react and deal with these situations. The course is designed to provide the competencies needed to work within the IT project environment.

This course will feature:

- Comprehensive understanding of the various processes of IT project management.
- Advanced set of project management tools & techniques for IT project application at the workplace.

Objectives

- Understand project management life cycle, methodology and terminologies.
- Apply project templates for IT project management and control
- Anticipate possible project problems, opportunities, action steps, project contingencies & project risks.
- Appreciate the use of project management software.
- Understand how to implement an IT Project Management Office.
